Instructions

1. **Calculate Cost-Efficiency Metrics:** Complete calculations to determine the **Cost per Mille (CPM)**, **Cost per Clicks (CPC)**, and **Cost per Acquisition (CPA)**. These are your Cost Efficiency Metrics.
    a. There are formulas on the last slide to help you through these calculations.
        - **Hint:** Each Cost Efficiency Metric has its own formula!
2. **Reporting on Campaign Results:**
    a. Input your results for the **Cost Efficiency Metrics** based on the **campaign objective**. 👈
    b. You will also need to calculate the percent difference. Then, explain what you would do with this campaign, based off the performance, benchmark and objective.
    c. Your explanation should **mention an action**: either **pause**, **continue** as is, or add **more** budget.
    d. **Explain** why you chose this action.
3. **LevelUp (Optional)**: Put your spreadsheet skills to the test to condense campaign data into a **pivot table**. Make sure the **Sum of Impressions, Sum of Clicks** and **Average CPC** are the values in the top row, and organized by **placements**.

NÖZ

Calculate Cost-Efficiency Metrics

	Budget	Spend	Impressions	Clicks	Conversions (Sales)	CPM	CPC	CPA
Noz_NozscreenUK_Traffic	$15,000	$4,500	987,337	5676	264	$4.56	$0.79	$17.05

Benchmarks:

CPM: $4.66 | CPC: $.75 | CPA: $10.98

Reporting on Campaign Results

What would you do with this campaign: **Continue as is.**

The campaign's traffic objective is being met reasonably well. CPC is only 5.33% above benchmark and CPM is actually better than benchmark, so performance is acceptable without needing to pause or add more budget.

Campaign Objective: Website traffic

Cost-efficiency metric: CPC

Benchmark	$0.75
Actual	$0.79
% Difference	+5.33%
